Northern Illinois University | Spring 2019

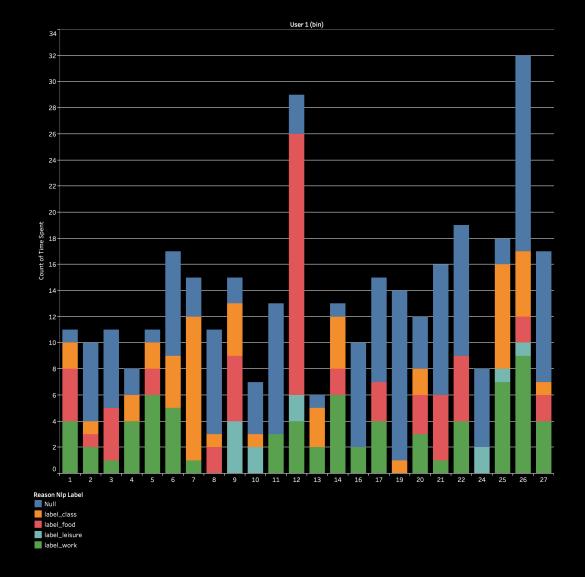

Plotting total time spent by every user as the week

Using the NLP module the reason for entering a building is categorised into four labels. We can see how the total time spent in NIU buildings is varying as the week is progressing.

We know that every user visits a certain building for a certain reason. Visualizing the reason why a user visited a certain building gives us the idea as to why users are flocking to a certain building.

Understanding every user's reason for entering a building

Using the NLP module we can now see the user behaviour and the sheer of the user's time for a specific reason. We can observe that except for a free users almost all of the users have spent time in classes and time in NIU buildings for work purposes.
